

Product Requirements Document

Problem

How do we enhance the post-order user support experience to quickly resolve any incorrect or delayed order / order items, thereby increasing trust in the platform.

Context

Urban users rely on Domino's for quick and reliable food delivery due to their busy schedules. However, issues such as incorrect or incomplete orders occasionally occur, especially during peak hours. The current resolution process often lacks speed and clarity, and in many cases, users are offered compensation such as vouchers instead of direct resolution. Since Domino's handles both preparation and delivery, users expect faster and more reliable issue resolution. Any inefficiency directly impacts customer satisfaction and trust.

Objectives

Business Objectives

- Improved customer satisfaction: Ensure users receive quick and effective resolution for issues like incorrect or delayed orders.
- Increase repeat orders: Build user trust through reliable support and service, encouraging more repeat orders and business continuity.
- Reduced churn rates: Minimize user drop-offs by providing a seamless and dependable post-order support experience.

User Objectives

- Quick and seamless mitigation of issues: Instead of relying on cashbacks or vouchers, ensure quick resolution of the issue, embarking trust and satisfaction in the users.
- Transparent workflow: Provide clear communication to emphasize seamless and transparent user experience.
- Minimal effort in reporting issue: Allow users to report issues easily with minimal steps and friction. User will not hesitate to reach out to the platform services in reporting an issue improving user trust.

User Personas

Persona	Persona 1 – Busy Urban Professional	Persona 2 – Restaurants and Cafes	Persona 3 – Delivery Partner
Background	Shreya, 25, software engineer in Ahmedabad, loves pizza and orders Domino's almost 3 days a week, often receives wrong orders during peak hours.	Arav, 30, owner of the nearest Domino's outlet of Shreya's area, is often short-handed on weekends and cannot keep track of orders smoothly.	Jay, 27, deliver partner for Domino's for 3 years, receives several calls for wrong orders, especially during rush hours and days, receives bad reviews due to the mistake of the restaurant.
Needs	Right order gets delivered to her; No need to compromise on incorrect orders; minimal effort to complain; correct the order and get what she wants.	Meet customer requirements; provide good customer service; maintain higher ratings of the outlet; increase repeat orders; reduced loss.	Increase ratings on the platform for more opportunities; not held responsible for the wrong orders.
Pain Points	Difficulty navigating support system; limited resolution options; lack of direct communication with the outlet employees or owner; have to rely on the application or the delivery partner.	Repeat orders decrease due to some mistakes; affect in business continuity; bad reviews about delayed or wrong orders; lower customer satisfaction rate; revenue loss due to delivery of higher price value at lower cost.	Held responsible for incorrect or missing orders; does not have any authority to resolve the issue if customer contacts; bad reviews on the platform as being held responsible for the issues.
Goals	Seamless post-order experience; multiple options to resolve the issue; direct contact with the restaurant about the wrong order.	Increase repeat orders; customer satisfaction; business continuity.	Not being held responsible; authority to take necessary action; appeal for extra pay for the travel time and effort.

User Stories

1. As a user, I want to report the missing or incorrect order easily, so the issue can be resolved quickly
2. As a user, I want several options to choose from, like refund or replacement for my order so that I have control over the outcome.
3. As a user, I want a simple and guided complaint flow, so that I don't have to navigate complex support systems.
4. As a user, I want clear communication from the customer support service while resolving the issue so that I do not have to contact the delivery partner.
5. As a responsible delivery partner, I want the issue to be transparent for me to ensure that I do not get penalized for any wrong reasons.
6. As the business's outlet owner, I want to be informed for any such discrepancy among customers to resolve the issue effectively and prevent negative reviews.
7. As a user, I want a quick replacement option for wrong items, so that I receive what I originally ordered.
8. As a user, I want to know how long my issue will take to resolve, so that I have clear expectations.

User Flow

The primary flow below traces the user from the wrong order delivered to the issue being resolved.

Entry: Order is delivered → user notices an incorrect, missing, or delayed item in their order.

Access Support: User navigates to the order details page and taps on the “**Help**” option to report an issue.

Identify Issue: User identifies the issue and selects the type of issue (e.g., wrong item, missing item, or delayed order) from predefined options.

Verification: User is asked to select the incorrect item delivered and upload a photo of the item received for verification.

Choose Resolution: After verifying, user selects a preferred resolution method such as **replacement** or **refund**.

Validation: System processes and validates the request by checking order details and issue type.

Order pick-up: Nearby delivery partner is assigned to pick up the wrong order item.

Confirmation: User is shown a confirmation screen with the selected resolution and an estimated time for resolution (ETA).

Resolution: Replacement order is initiated or refund is processed; in both cases the incorrect item will be collected by the delivery partner.

Tracking: User receives real-time updates on the status of their request until the issue is fully resolved.

Requirements

Technical Requirements

- **Platforms:** The feature should be available on iOS, Android, and web platforms within the existing Domino's app and website.
- **Backend integration:** The system should connect with the existing order management system to fetch order details and validate issues.
- **Image validation support:** The system should allow verification of the image uploaded.
- **Issue tracking system:** A backend system should store and track all reported complaints and their status.
- **Notification system:** Users should receive updates through push notifications or SMS regarding their issue status.
- **Delivery partner tracking:** The system should track the delivery partner assigned to pick up the item.
- **APIs:** APIs should be used to connect customer support, order database, and delivery management system.

- Data logging: All issue reports and resolutions should be logged for future analysis and improvement.

Design Requirements

- The issue reporting flow should be simple and not exceed 4–5 steps.
- UI should be clean and easy to understand, avoiding too much information at once.
- Use clear labels like “Wrong Item”, “Missing Item”, “Delayed Order”.
- Show confirmation and status screens in a user-friendly way.
- Provide visual indicators (like progress or status updates) to keep users informed.

Functional Requirements

- The system must allow users to report issues directly from the order details page.
- The system must provide predefined issue categories (wrong item, missing item, delay).
- The system must allow users to identify and select the specific item that is incorrect from the order list.
- The system must allow users to choose between refund or replacement.
- The system must allow users to upload an image of the received item for verification.
- The system must validate the request based on order details, the incorrect item chosen and the image uploaded.
- The system must show an estimated resolution time (ETA).
- The system must notify users about updates in real-time.
- The system must initiate refund or replacement based on user selection.
- The system must assign and notify a nearby delivery partner to pick up the wrong order item.
- The system should allow internal teams (store/delivery) to view and act on complaints.

Non-Functional Requirements

- Performance: The issue reporting feature should load within 2–3 seconds.

- Scalability: The system should handle high traffic during peak hours (weekends).
- Reliability: The system should work consistently without failures during complaint submission.
- Availability: The feature should be accessible at all times, including peak hours.
- Security: User data and order details should be securely handled.
- Usability: The feature should be easy to use without requiring any instructions.

Edge Cases

1. **Multiple items incorrect:** User receives more than one incorrect item → system should allow selecting multiple items instead of forcing separate complaints.
2. **User selects wrong item by mistake:** User reports the wrong item incorrectly → system should allow editing or cancelling the complaint within a short time window.
3. **No delivery partner available for pickup:** Replacement requested but no delivery partner is available nearby → system should offer refund as fallback or delayed pickup option.
4. **Store unable to replace item:** Item is out of stock at the store → system should automatically suggest refund or alternative item.
5. **Image upload failure:** User is unable to upload image due to network issues → system should allow complaint submission without image (but flag for manual review).
6. **Fraudulent claims:** User repeatedly reports false issues → system should flag such accounts for review and limit certain actions.
7. **Late complaint submission:** User reports issue long after delivery → system should restrict resolution options (e.g., refund only, no replacement).
8. **Duplicate complaints:** User raises multiple complaints for the same order → system should merge or prevent duplicate requests.

Impact and Metrics

To evaluate the effectiveness of the improved issue resolution system, the following metrics focus on speed, user experience, and trust recovery.

Metric	What it Measures	Current Gap (Before)	Expected Improvement (After)	Why it Matters
Average Resolution Time	Time taken to resolve a complaint	High due to back-and-forth chatbot interactions	Reduced by 40–50%	Faster resolution directly improves user satisfaction
Complaint Completion Rate	% of users who successfully complete the complaint flow	Drop-offs due to complex and unclear flow	Increase to 85–90%	Indicates reduced friction and better usability
User Effort (Steps to Resolution)	Number of steps/interactions needed to resolve an issue	Multiple steps with repeated inputs	Reduced to 4–5 structured steps	Lower effort increases likelihood of issue reporting
CSAT (Post-Resolution)	User satisfaction after issue resolution	Low due to compensation-based outcomes	Improved to 4.5+/5	Measures quality of resolution, not just speed
Resolution Accuracy	% of issues resolved correctly in first attempt	Errors due to unclear problem identification	Significant improvement with item-level selection	Reduces rework and improves operational efficiency
Support Dependency Rate	% of users needing manual support escalation	High due to chatbot limitations	Reduced significantly	Indicates system self-sufficiency

				and scalability
Repeat Order Rate (Post-Issue)	% of users who reorder after a negative experience	Drop due to poor resolution experience	Increase by 15–25%	Direct indicator of trust recovery

North-Star Metric

Trust Recovery Rate: Percentage of users who place another order after experiencing and resolving an issue

This metric captures the true success of the system—whether it not only resolves problems, but rebuilds user confidence in the platform.
